

# General household survey

## July 2002

Co-operation between Statistics South Africa (Stats SA), the citizens of the country, the private sector and government institutions is essential for a successful statistical system. Without continued co-operation and goodwill, the timely release of relevant and reliable official statistics will not be possible.

Stats SA publishes approximately three hundred different releases each year. It is not economically viable to produce them in more than one of South Africa's eleven official languages. Since the releases are used extensively, not only locally, but also by international economic and social-scientific communities, Stats SA releases are published in English only.

<b>8.</b>	<b>Assets</b>	
8.1	Households with and without access to land for agricultural purposes, by province	59
8.2	Households with and without access to land for agricultural purposes, by population group and sex of the household head	60
8.3	Households with access to land for agricultural purposes, by farming activity and province	61
8.4	Households with access to land for agricultural purposes, by farming activity, population group and sex of the household head	62
8.5	Households that have received/ have not received a government land grant for residence or farming, by province	63
8.6	Households that have received/ have not received a government land grant for residence or farming, by population group and sex of the household head	64
<b>9.</b>	<b>Income and expenditure</b>	
9.1	Households by main source of income, population group and sex of the household head	65
9.2	Households by total expenditure in the month prior to the interview, population group and sex of the household head	66
9.3	Households receiving one or more grants, by type of grant, population group and sex of the household head	67
<b>10.</b>	<b>Transport</b>	
10.1	Transport to the nearest pre-primary school	
10.1.1	Households with children attending pre-primary school, by usual means of transport and population group of the household head	68
10.1.2	Households with children attending pre-primary school, by time taken to reach the school and population group of the household head	69
10.2	Transport to the nearest primary school	
10.2.1	Households with children attending primary school, by usual means of transport and population group of the household head	70
10.2.2	Households with children attending primary school, by time taken to reach the school and population group of the household head	71
10.3	Transport to the nearest secondary school	
10.3.1	Households with children attending secondary school, by usual means of transport and population group of the household head	72
10.3.2	Households with children attending secondary school, by time taken to reach the school and population group of the household head	73
10.4	Transport to the nearest welfare office	
10.4.1	Households who made use of a welfare office, by usual means of transport and population group of the household head	74
10.4.2	Households who made use of a welfare office, by time taken to reach the welfare office and population group of the household head	75
10.5	Transport to the nearest clinic	
10.5.1	Households with people who consulted a clinic in the month prior to the interview, by usual means of transport and population group of the household head	76

10.5.2	Households with people who consulted a clinic, by time taken to reach the clinic and population group of the household head	77
10.6	Transport to the nearest hospital	
10.6.1	Households by usual means of transport to the hospital, province, and population group of the household head	78
10.6.2	Households by time taken to reach the hospital, province, and population group of the household head	80
10.7	Transport to the nearest food market	
10.7.1	Households by usual means of transport to the food market, province, and population group of the household head	82
10.7.2	Households by time taken to reach the food market, province, and population group of the household head	84
10.8	Transport to the nearest post office agent	
10.8.1	Households by usual means of transport to the post office agent, province, and population group of the household head	86
10.8.2	Households by time taken to reach the post office agent, province, and population group of the household head	88

# General Household Survey Report

## 1 Introduction

This report presents the results of the General Household Survey (GHS) conducted in July and August 2002 by Statistics South Africa. The survey collected information on a variety of subjects including education, health, labour market, births, access to services and facilities, and quality of life.

### 1.1 Background of the survey

Statistics South Africa conducted the October Household Survey (OHS) annually from 1994 to 1999, based on a probability sample of a large number of households ranging from 16 000 households to 30 000 households each year (depending on availability of funding). This survey was discontinued in 1999 due to the re-prioritisation of surveys in the face of financial constraints. February 2000 saw the birth of the Labour Force Survey (LFS), which is a biannual survey conducted by Statistics South Africa in March and September of each year. The LFS covers some areas previously covered by the OHS but not all, since it is a specialised survey principally designed to measure the dynamics in the labour market. The LFS of September each year includes a section designed to measure social indicators such as access to infrastructure. Again, this section does not go into as much depth as the OHS used to.

A need was therefore identified by the users of Statistics South Africa for a regular survey designed specifically to measure the level of development and performance of government programmes and projects. The GHS was developed for this purpose. The first round of the GHS was conducted in July/August 2002. This report gives the results of the first round of the GHS.

### 1.2 Purpose of the study

The main purpose of the GHS is to measure the level of development and performance of various government programmes and projects. This report specifically aims at providing national indicators on various living conditions such as access to services and facilities, education and health, for 2002. It also draws comparisons between the GHS 2002 results and the Census 2001 results.

### 1.3 Methodology

#### 1.3.1 Sampling<sup>1</sup>

A multi-stage stratified sample was drawn to run the GHS in 2002. In the initial stages, probability proportional to size principles were applied. The first stage was stratification by province, then by type of area within each province (urban or non-urban). Primary sampling units (PSUs) were then selected within each stratum. The smaller provinces were given a disproportionately large number of PSUs compared to the bigger provinces. Systematic sampling was then applied within each PSU to select 10 dwelling units (including units in hostels), as ultimate sampling units. All households at the selected dwelling units were interviewed. A sample comprised 30 000 dwelling units. Out of these, 1 313 dwelling units were found to be out of scope. Of the valid dwelling units, 3 439 households did not respond and 26 287 responded.

#### 1.3.2 Weighting<sup>2</sup>

A three-stage weighting procedure was done on the GHS 2002 that resulted in two sets of weights, household weights and person weights. The person weights are identical for all persons within a given household. Details of the derivation of the weights are provided in the Technical Notes.

---

<sup>1</sup> See technical notes for detailed information

<sup>2</sup> See technical notes for detailed information

### **1.3.3 Questionnaire and data collection**

The questionnaire was designed taking into consideration the need to compare results of this survey to the one conducted in June 2001 in the 13 nodal areas identified as priority areas for the Integrated Rural Development Strategy (IRDS), namely, the Social Development Indicators Survey (SDIS). The questions in the GHS were similar to the ones used in the SDIS as proposed by representatives of departments in the social cluster of government responsible for implementation of the IRDS.

Data was collected from 20 July to 2 August 2002 by trained fieldworkers in all nine provinces. Face-to-face interviews were used as a method of data collection.

## **1.4 Limitations of the study**

Household surveys in general are limited by their conceptualisation and implementation strategies, including survey and sampling design, sample size, questionnaires and the implementation of fieldwork, data-capture processes and editing. The extent of some errors, for example sampling errors, can be estimated, while others cannot, for example non-sampling errors that occur during fieldwork and the interpretation of the meaning of questions by respondents. Statistics South Africa, through its survey programmes, tries to reduce both these sources of error.

Comparisons of the results of the GHS to the results of earlier surveys (October Household Surveys and Labour Force Surveys) could not be made in this report because the population estimates for this survey are based on the Census 2001 results, whereas the population estimates for the previous surveys were based on Census 1996. Statistics South Africa is currently benchmarking the results of the previous surveys to the Census 2001 count.

While comparisons could be made at individual level between Census 2001 and GHS 2002, comparisons at household level could not be made because of different methodologies during data collection. For example, during census data collection, some hostels were treated differently from the way they are treated in surveys. In future hostels will be treated in a similar manner as census to allow the comparison.

Comparisons between Census 2001 and GHS 2002 are also not possible on the labour market information, as the questions were asked differently. The GHS had more probing questions on labour market status than the census. Comparisons between the GHS and the corresponding Labour Force Survey (LFS) results could also not be done, since the GHS weights are benchmarked to Census 2001 population estimates and the LFS September 2002 weights are benchmarked to the Census 1996 population estimates.

Surveys and population censuses differ in their nature and methodology, which makes them more appropriate to measure certain phenomena, and less appropriate to measure others. For example, a census may not be appropriate to measure labour market information (as described in the above paragraph) because there is no room for probing questions, whereas surveys may be more appropriate because probing leads to more detailed information. Similarly when comparing information on education as measured by a census and as measured by a survey, the proportion of people with no education may differ. A census may show a significantly higher proportion of people with no education than a survey. This may be partly explained by fieldwork anomalies in a survey.

## **1.5 Comparisons with other surveys**

As noted above, it is not advisable to compare the results of the first GHS with those of the five rounds of the OHS or with the SDIS, since the GHS is benchmarked to Census 2001, while the other surveys are presently benchmarked to Census 1996. The results of the GHS 2002 will be comparable with these other surveys once they have been benchmarked to Census 2001.

## 2 Main findings

### 2.1 Population

In July/August 2002, the South African population was estimated to consist of 45,5 million people. Statistics South Africa is 95% confident that the true population size lies somewhere between 44,6 million and 46,3 million people<sup>1</sup>. According to Census 2001, the total population in South Africa in October 2001 amounted to 44,8 million people. Figure 1 indicates population size by province in October 2001 and in July/August 2002. There was a slight increase in the population size in every province except Northern Cape, which shows a slight decrease from 823 000 people in October 2001 to an estimated 819 000 people in July 2002.

**Figure 1: Estimated population by province, October 2001 and July/August 2002**

Even though growth was found in all provinces, the share of the population among provinces did not change. Figure 2 presents the distribution of the population by province as measured in 2001 by the census and in 2002 by the GHS. It indicates that KwaZulu-Natal had the largest proportion of people in South Africa and Northern Cape had the smallest, even though Northern Cape is the largest in area.

<sup>1</sup> See technical notes on confidence intervals

**Figure 2: Percentage of the population in each province, July/August 2002**

**2.2 Education**

The results of the GHS 2002 indicate that of those aged 20 years and above and no longer attending any educational institution, the highest proportion left school with some secondary education but before finishing Grade 12 (approximately 31,1%), while 20,6% had finished Grade 12 and 8,2% had educational qualifications higher than Grade 12.

**Figure 3: Distribution of people 20 years and older not attending an educational institution by highest level of education, July/August 2002**

Figure 4 examines the same variable by population group. Africans had the highest percentage of people of this age group with no formal education (15,3%). On the other hand, only 0,2% of whites of this age group had no education, while the percentages with some primary education or complete primary school were higher but still less than 1,0%. It is noted that in all population groups except the white group, the highest proportion had left school with some secondary education, but before they finished Grade 12. Among whites the largest proportion was of people who had completed Grade 12.

**Figure 4: Distribution of people aged 20 years and older not attending an educational institution by highest level of education and population group, July/August 2002**

It is compulsory in South Africa for children aged 7 to 15 years to be attending an educational institution or to be receiving formal education. The results of the survey indicate that 3,4% of the children aged 7 to 15 years were not attending any educational institution. Figure 5 shows the percentage in each population group. The percentage of coloured children not attending an educational institution was higher (4,1%) than the other population groups (approximately 3,6% for African children, 0,7% for white children and 0,5% for Indian/Asian children). Among those not attending an educational institution, 37% cited ‘no money for school fees’ as the main reason for not attending, while 8,6% said ‘education is useless or uninteresting’.

**Figure 5: Proportion of children aged 7 to 15 years in each population group not attending school, July/August 2002**

**2.3 Health**

Figure 6 gives the proportions of people with access to a medical aid scheme in each population group. It shows that:

- Overall, approximately 15,2% of the population in South Africa were covered by a medical aid scheme.
- The majority of the white population had access to a medical aid scheme (68,2%), followed by Indians/Asians (29,0%), and then coloureds (18,8%). The African population had the smallest proportion of people with access to a medical aid scheme (8,0%).

**Figure 6: Proportion of people in each population group with medical aid coverage, July/August 2002**

Figure 7 indicates the proportion of people in each population group who were sick in the month prior to the survey and consulted a health worker, by the work sector of the health worker (public or private). The figure shows that 57,2% consulted in a public sector and 42,8% in the private sector. When looking at this by population group, the following was found:

- The majority of Africans and coloureds consulted in the public sector (63,5% and 60,9% respectively) whereas the majority of Indians/Asians and whites consulted in the private sector (61,9% and 83,1% respectively).
- Whites had the highest proportion of people who consulted in the private sector, followed by Indians/Asians, coloureds and Africans.

**Figure 7: Distribution of those who consulted a health worker in each population group by sector of the health worker**

Table A indicates that 12,9% of the people who consulted in the public sector were dissatisfied with the service they received. On the other hand, only 2,9% who consulted in the private sector were dissatisfied with the service.

**Table A: Number and percentage of those who consulted in the private and public health sector, by level of satisfaction with the service received: GHS 2002**

Level of satisfaction	Public sector		Private sector	
	('000s)	%	('000s)	%
Very satisfied	1 413	57,7	1 578	86,3
Somewhat satisfied	570	23,3	156	8,5
Neither satisfied nor dissatisfied	139	5,7	36	2,0
Somewhat dissatisfied	127	5,2	23	1,3
Very dissatisfied	189	7,7	30	1,6
Unspecified	10	0,4	5	0,3
Total	2 448	100,0	1 828	100,0

## 2.4 Social welfare

In July/August 2002, 3,9% of the population had used the social welfare office in the 12 months prior to the survey interview. This facility is most likely to be used by women, especially African women. Figure 8 indicates the percentages of each population group who made use of this facility.

- Overall, 5,3% of women used the social welfare office and 2,4% of men.
- In all population groups, the percentage of women who used the social welfare office exceeded that of men. However, among the Indian/Asian population, the difference between the percentages of men and women was not as pronounced as in other population groups.
- African and coloured women had the highest percentage of those who made use of the welfare office (5,7% for both), and African women constitute about 61% of the total number of people (both men and women in all population groups) who made use of this facility.

**Figure 8: Proportion of males and females in each population group who made use of a social welfare office in the 12 months prior to the survey interview: GHS 2002**

Figure 9 indicates that of the 3,9% of the population who made use of the social welfare office, most were seeking a social grant (82,3%), followed by social worker services (22,1%) and then poverty relief (2,4%).

**Figure 9: Of those who made use of a social welfare office in the 12 months prior to the interview, the percentage who sought each type of service or assistance: GHS 2002**

## 2.5 The labour market in July/August 2002

Stats SA uses two definitions of unemployment, the official definition and the expanded definition<sup>1</sup>.

In Table B and Table C, Stats SA gives the overall labour market trends for July/August 2002, based on the official and expanded definition of unemployment respectively. They look at:

- the estimated total number of people in the age category 15-65 years (those of working age),
- the number of people in this age category who were not economically active (for example, full-time students, full-time homemakers, retired people and the disabled who are unable to work),
- those who were economically active (both the employed and the unemployed according to the official definition of unemployment),
- the labour market participation rate (the percentage of all people aged 15-65 years who are economically active), and
- the labour absorption rate (the percentage of all those aged 15-65 years who are actually employed) in July/August 2002.

Table B (based on the official definition) shows that, in July/August 2002, there were an estimated 28,9 million people aged between 15 and 65 years. Among these people:

- 16,3 million were economically active, of whom
  - 11,4 million were employed, and
  - 4,9 million were unemployed.

The unemployment rate (according to the official definition) was estimated to be 30,3%.

<sup>1</sup> See definition of terms

**Table B: Labour market trends in July/August 2002 according to the official definition of unemployment**

		N (1000)
A	Total employed	11 382
B	Total unemployed (official definition)	4 941
C	Total economically active = a + b	16 323
D	Total not economically active	12 614
E	Total aged 15–65 years = c + d	28 937
F	Unemployment rate = $b * 100 / c$	30,3%
G	Labour market participation rate = $c * 100 / e$	56,4%
H	Labour absorption rate = $a * 100 / e$	39,3%

Table C (based on the expanded definition) on the other hand, shows that among the estimated 28,9 million people aged 15 to 65 years in July/August 2002,

- 19,1 million were economically active, of whom
  - 11,4 million were employed, and
  - 7,7 million were unemployed.

The unemployment rate (according to the expanded definition) was estimated to be 40,3%.

**Table C: Labour market trends in July/August 2002 according to the expanded definition of unemployment**

		N( 1000)
A	Total employed	11 382
B	Total unemployed (expanded definition)	7 686
C	Total economically active = a + b	19 068
D	Total not economically active	9 869
E	Total aged 15–65 years = c + d	28 937
F	Unemployment rate = $b * 100 / c$	40,3%
G	Labour market participation rate = $c * 100 / e$	65,9%
H	Labour absorption rate = $a * 100 / e$	39,3%

## 2.6 Household information

One of the purposes of the GHS is to measure development indicators in the country by looking the type of dwellings in which households live, and access to infrastructure, such as piped water, electricity, hygienic toilet facilities, refuse removal and telephones. Comparisons of the results of GHS 2002 to the Census 2001 results are made.

### 2.6.1 Type of dwelling

Figure 10 indicates the proportion of households in each population group living in formal dwellings<sup>1</sup> in July/August 2002.

- Overall, 73,8% of the households in South Africa lived in formal dwellings in July/August 2002.
- White-headed households had the highest percentage of households living in formal dwellings (99,3%), followed by Indian/Asian- (99,0%), then coloured- (91,7%) and lastly African-headed households (67,0%).

<sup>1</sup> See definition of terms

**Figure 10: Proportion of households living in formal dwellings by population group of the household head, July/August 2002**

**2.6.2 Access to piped water in the dwelling or on site**

Figure 11 indicates the proportion of households with access to piped water in the dwelling or on site in July/August 2002.

- The majority of households in South Africa had access to piped water in the dwelling or on site (67,6%).
- The proportion of households with access to water in the dwelling or on site among African-headed households was 59,1%, while for all other groups it was above 90,0%, with the largest proportion among Indian-headed households (99,3%).

**Figure 11: Proportion of households in each population group with access to piped water in the dwelling or on site, July/August 2002**

Figure 12 indicates that most of the households in South Africa had access to clean water<sup>1</sup> for domestic use, both overall (84,4%) and in all population groups (80,4% for African-headed households and 98,0% for households headed by members of other population groups). On the other hand, the proportion of households using other sources was higher for African-headed households than for households headed by members of other population groups, in both groupings given in the figure.

**Figure 12: Distribution of households in each population group by water source, July/August 2002**

**2.6.3 Access to a hygienic toilet facility<sup>2</sup>**

Figure 13 indicates the proportion of households with access to a hygienic toilet facility in each population group in July/August 2002. Approximately 60,9% of the households in South Africa had access to a hygienic toilet facility. White-headed households had the highest proportion with access to a hygienic toilet facility (99,7%), followed by Indian/Asian- (98,9%), coloured- (88,0%) and then African-headed households (50,5%).

<sup>1</sup> See definition of terms

<sup>2</sup> See definition of terms

**Figure 13: Proportion of households in each population group with access to a hygienic toilet facility, July/August 2002**

Figure 14 indicates the distribution of households in each population group by toilet facility.

- Among African-headed households, only 44,6% had access to a flush or chemical toilet (in the dwelling, on site or off site) in July/August 2002, compared with 94,8% of the households headed by other population groups.
- African-headed households had the largest proportion using pit latrines (39,8%), whilst only 2,3% of households headed by other population groups used pit latrines.

**Figure 14: Distribution of African-headed households and all other households by toilet facility, July/August 2002**

**2.6.4 Electricity**

Figure 15 gives proportions of households using electricity for cooking, lighting and heating in July/August 2002 by population group of the head of the household. The results indicate that:

- Overall, and within each population group, the majority of households use electricity for lighting.

- However, the proportion of African-headed households using electricity is smaller than of households headed by other population groups, for all three purposes.

**Figure 15: Proportion of African-headed households and other households using electricity for cooking, heating and lighting, July/August 2002**

**2.6.5 Refuse removal**

Figure 16 indicates the proportion of households in each population group which have their refuse removed by the local authority in July/August 2002.

- More than half the households in South Africa had their refuse removed by the local authority (56,4%).
- Indian-headed households had the highest proportion with access to this facility (96,2%), followed by white-headed households (90,4%), and then coloured-headed households (81,5%). African-headed households had the smallest proportion with their refuse removed by local authority (47,0%).

**Figure 16: Proportion of households in each population group with refuse removed by local authority, July/August 2002:**

**2.6.6 Access to a telephone or regular use of a cellular telephone**

Figure 17 indicates the proportions of households in each population group with access to a telephone in the dwelling or regular use of a cellular telephone in July/August 2002. Overall, 44,3% of the households in South Africa had access to a telephone in the dwelling or regular use of a cellular telephone: 94,8% of white-headed households, 86,2% of Indian/Asian-headed households, 52,4% of coloured-headed households and 33,9% of African-headed households.

**Figure 17: Proportion of households in each population group with access to a telephone or regular use of a cellular phone, July/August 2002**

Statistics South Africa

### 3 Technical notes

#### 3.1 Sample design

A multi-stage stratified sample was drawn using probability proportional to size principles. The first stage is stratification by province, then by type of area within each province. Primary sampling units (PSUs) were then selected proportionally within each stratum (urban or non-urban) in all provinces. Altogether 3000 PSUs were selected. Within each PSU ten dwelling units were selected systematically for enumeration.

The sample was drawn from the master sample, which Statistics South Africa uses to draw samples for its surveys. The master sample is drawn from the database of enumeration areas (EAs), as was established during the demarcation phase of census 1996. As part of the master sample, small EAs consisting of fewer than 100 dwelling units are combined with adjacent EAs to form primary sampling units (PSUs) of at least 100 dwelling units, to allow for repeated sampling of dwelling units within each PSU. The sampling procedure for the master sample involves explicit stratification by province and within each province, by urban and non-urban areas. Independent samples were drawn from each stratum within each province. The smaller provinces were given a disproportionately larger number of PSUs than the bigger provinces.

The master sample is divided into five independent clusters. In order to avoid respondent fatigue, the sample for GHS was drawn from a different cluster from the two clusters already being used for the LFS, which is a twice-yearly rotating panel survey. Altogether 30 000 dwelling units (including units in hostels) were visited for the GHS 2002.

#### 3.2 Weighting the GHS of July/August 2002

A two-stage theoretical weighting procedure was done on the GHS 2002. In the first stage primary sampling units (PSU) are selected with probability proportional to size (PPS) from the census population. The PSU inclusion probability is given by

$$P_{PSU} = \frac{n_{PSU}}{N_{PSU}} . n_S ,$$

where  $n_{PSU}$  is the number of households constituting the selected PSU during census fieldwork,  $n_S$  is the number of PSUs per stratum, and  $N_{PSU}$  is the number of households constituting the selected stratum during census fieldwork. For GHS urban and rural strata were considered. In the second stage dwelling units were selected sequentially from each PSU in the sample to form clusters of ten dwelling units. The household inclusion probability per PSU is given by

$$P_{HH} = \frac{n_{HH}}{H_{HH}} . r_{HH} ,$$

where  $n_{HH}$  is the number of selected dwelling units per PSU,  $H_{HH}$  is the number of household in the PSU in question at a particular time different from the census time, and  $r_{HH}$  is the response rate given by

$$r_{HH} = \frac{n_{RESP}}{n_T}$$

where  $n_{RESP}$  is the number of responding households and  $n_T$  is the total number of visited households per PSU. The adjusted sample weights are now given by

$$W_{HH} = \frac{1}{P_{PSU} . P_{HH}}$$

Because there were undercounts in some PSUs (because households could not be traced or because of refusals to answer), the weight of each such PSU was adjusted upwards by a factor of  $n_{HH}/n^*_{HH}$  where  $n_{HH}$  was the number of households which should have been interviewed and  $n^*_{HH}$  was the number of households actually reached. Then all household weights were adjusted upwards by a further factor equal to the estimated population at the time of the GHS 2002 survey divided by the 1996 Census population estimate, to account for population growth between the 1996 Census (from which the master sample was drawn) and the date of the survey. These doubly adjusted weights are reported as the household weights in the data set.

The person weights are derived by further adjusting the household weights in order to reproduce the marginal totals of the estimated population at the time of the 2002 GHS by gender, population group, province and age group. A SAS macro called CALMAR was used for this purpose.

The population estimate was derived by a ‘bottom up’ (cohort-by-cohort) exponential extrapolation from the 1996 and 2001 censuses. Such an estimate is quite reliable for the total population and the gender, population group and provincial subtotals. It is less reliable for the age distribution. Improved population estimates will become available when Statistics South Africa completes its short-term population projection model. The weights in this and other surveys may be modified in the light of model estimates.

### 3.3 Coverage

The target population is private households in all nine provinces of South Africa and residents in workers’ hostels. The survey does not cover other collective living quarters such as students’ hostels, old age homes, hospitals, prisons and military barracks.

### 3.4 Urban and non-urban areas

Even though stratification during sampling was done by type of area – urban and non-urban, analysis based on an urban/non-urban breakdown has not been done, because Stat SA is in the process of investigating the definition of these terms in the light of the new municipal dispensation.

### 3.5 Confidence intervals

Table D is read as follows. In the row marked RSA and the column labeled ‘Estimate’ we see that the South African population was estimated at 45,5 million people in July/August 2002. The lower limit of this estimate, within 95% confidence limits, is 44,6 million, while the upper limit is 46,3 million. In other words, we are 95% sure that the actual number of people in South Africa in July/August 2002 was somewhere between 44,6 million and 46,3 million, taking sampling error into account.

**Table D: Estimated population of South Africa, July/August 2002**

Province	95% confidence limits		
	Lower limit (’000)	Estimate (’000)	Upper limit (’000)
<b>RSA</b>	<b>44 598</b>	<b>45 453</b>	<b>46 308</b>
KwaZulu-Natal	9 986	9 531	10 075
Gauteng	8 650	9 077	9 503
Eastern Cape	6 195	6 483	6 772
Limpopo	5 124	5 313	5 502
Western Cape	4 383	4 612	4 841
North West	3 548	3 721	3 895
Mpumalanga	3 001	3 178	3 355
Free State	2 578	2 719	2 860
Northern Cape	756	819	883

### 3.6 Estimation and use of standard error

The published results of the General Household Survey are based on representative probability samples drawn from the South African population, as discussed in the section on sample design. Consequently, all estimates are subject to sampling variability. This means that the sample estimates may differ from the population figures that would have been produced if the entire South African population had been included in the survey. The measure usually used to indicate the probable difference between a sample estimate and the corresponding population figure is the *standard error (SE)*, which measures the extent to which an estimate may have varied by chance because only a sample of the population was included.

There are two major factors, which influence the value of a standard error. The first factor is the sample size. Generally speaking, the larger the sample size, the more precise the estimate and the smaller the standard error. Consequently, in a national household survey such as the LFS, one expects more precise estimates at the national level than at the provincial 201 level due to the larger sample size involved. The second factor is the

variability between households of the parameter of the population being estimated, for example, the number of unemployed persons in the household.

Figure 18 indicates that:

- the standard error for the employed is 0,0105 (CV) x 11 382 000 (the employed) = 119 511,
- the standard error for the unemployed is 0,0192 (CV) x 4 941 000 (the unemployed) = 94 867,
- the standard error for the economically active is 0,0093 (CV) x 16 323 000 (the economically active) = 151 804, and
- the standard error for the unemployment rate is 0,0140 (CV) x 30,3 (unemployment rate) = 0,42.

**Figure 18: Coefficient of variation (CV) by estimate for the employed, the unemployed, the unemployment rate and the economically active (using the official definition of employment), July/August 2002**

## 4 Definition of terms

*The population of working age* – People aged 15–65 years.

*Not economically active population* includes people who are not available for work, such as full-time scholars and students, full-time homemakers, those who are retired and those who are unable or unwilling to work.

*Economically active population* includes people aged 15–65 who are employed and those not employed.

### *Official and expanded definition of unemployment*

Statistics South Africa (Stats SA) uses the following definition of unemployment as its official definition. The *unemployed* are those people within the economically active population who: (a) did not work during the seven days prior to the interview, (b) want to work and are available to start work within a week of the interview, and (c) have taken active steps to look for work or start some form of self-employment in the four weeks prior to the interview. The expanded unemployment rate excludes criterion (c).

*Workers* include the self-employed, employers and employees.

*Formal dwellings* include a brick structure on a separate stand, flat or apartment in a block of flats, townhouses, room in backyard and rooms or flatlets.

*Informal dwellings* include shacks or shanties in informal settlements or in backyards.

*Piped water in dwelling or on site* – refers to piped water inside the dwelling structure or on site. It excludes water from a neighbour's tap or a public tap that is not on site.

*Clean water* – refers to piped water (regardless of where) and water from a water tanker.

*Electricity for cooking, heating and/or lighting* – refers to electricity from public supply.

*Hygienic toilet facility* – refers to a flush toilet, chemical toilet and a pit latrine with a ventilation pipe.

*Access to a telephone or regular use of a cellular phone* – refers to a telephone inside the dwelling or a regular use of a cellular telephone.

*Urban/ non-urban* – see note 3.4 above.

## 1. Population

### 1.1 By province, population group and sex

Totals include other unspecified population group and sex.

Due to rounding the numbers do not necessarily add up to totals.

## 5. Social welfare

### 5.3 Population who made use of a welfare office in the 12 months prior to the interview, by province and the service sought

N (1 000)

Province	Service/assistance sought				At least one service
	Social worker	Poverty relief	Social grant	Other	
<b>Total</b>	<b>392</b>	<b>42</b>	<b>1 461</b>	<b>49</b>	<b>1 775</b>
Western Cape	46	5	96	0	126
Eastern Cape	95	2	295	9	351
Northern Cape	13	7	70	1	80
Free State	32	2	122	3	148
KwaZulu-Natal	46	3	138	5	181
North West	27	5	152	3	177
Gauteng	65	9	293	21	358
Mpumalanga	35	4	140	4	170
Limpopo	34	6	154	1	184

For all values of 10 000 or lower the sample size is too small for reliable estimates.

0 = more than nothing but less than 500

Due to rounding the numbers do not necessarily add up to totals.

## 5. Social welfare

### 5.4 Population who made use of a welfare office in the 12 months prior to the interview, by population group, sex and service sought

N (1 000)

Population group and sex	Service/assistance sought				At least one service
	Social worker	Poverty relief	Social grant	Other	
<b>All population groups</b>					
<b>Total</b>	<b>392</b>	<b>42</b>	<b>1 461</b>	<b>49</b>	<b>1 775</b>
Male	122	12	407	23	520
Female	269	30	1 052	26	1 253
<b>Black African</b>					
<b>Total</b>	<b>322</b>	<b>32</b>	<b>1 234</b>	<b>41</b>	<b>1 498</b>
Male	101	9	326	19	421
Female	221	23	907	22	1 076
<b>Other*</b>					
<b>Total</b>	<b>70</b>	<b>10</b>	<b>226</b>	<b>8</b>	<b>277</b>
Male	22	3	81	4	100
Female	48	7	145	4	177

\* Other includes coloured, Indian/Asian, white and unspecified population groups. These groups are aggregated due to the small sample size.

For all values of 10 000 or lower the sample size is too small for reliable estimates.

Totals include unspecified sex.

Due to rounding the numbers do not necessarily add up to totals.

## 6. Population of working age (15-65 years)

### 6.1 By population group, sex and labour market status

#### 6.1.1 Official definition of unemployment

Population group	Male						Female						Total					
	Total	Not economically active	Economically active				Total	Not economically active	Economically active				Total	Not economically active	Economically active			
			Total	Workers	Unemployed	Unemployment rate			Total	Workers	Unemployed	Unemployment rate			Total	Workers	Unemployed	Unemployment rate
	N (1 000)					%	N (1 000)					%	N (1 000)					%

For all values of 10 000 or lower the sample size is too small for reliable estimates.

0 = more than nothing but less than 500

Due to rounding numbers do not necessarily add up to totals.

## 7. Dwellings and services

### 7.14 Households by type of refuse removal and population group of the household head

N (1 000)

Refuse removal	Population group of household head				Total
	Black African	Coloured	Indian/Asian	White	
<b>Total</b>	<b>9 072</b>	<b>930</b>	<b>282</b>	<b>1 479</b>	<b>11 780</b>
Removed by local authority at least once a week	4 050	746	269	1 322	6 401
Removed by local authority less often than once a week	217	12	3	14	246
Removed by community members at least once a week	45	12	-	8	65
Removed by community members less often than once a week	19	5	4	2	29
Communal refuse dump/communal container	309	30	1	17	357
Own refuse dump	3 740	96	4	98	3 942
No rubbish removal	646	25	0	6	677
Other	31	3	1	6	41
Unspecified	16	1	1	6	23

For all values of 10 000 or lower the sample size is too small for reliable estimates.  
 Totals include other and unspecified population group of the head of the household.  
 0 = more than nothing but less than 500  
 Due to rounding numbers do not necessarily add up to totals.

## 8. Assets

### 8.1 Households with and without access to land for agricultural purposes, by province

N (1 000)

Province	Access to land		Total
	Have access	Do not have access	
<b>South Africa</b>	<b>1 702</b>	<b>10 060</b>	<b>11 780</b>
Western Cape	21	1 192	1 214
Eastern Cape	776	836	1 612
Northern Cape	11	213	224
Free State	44	701	745
KwaZulu-Natal	427	1 856	2 287
North West	59	924	984
Gauteng	26	2 674	2 709
Mpumalanga	39	744	784
Limpopo	301	920	1 221

For all values of 10 000 or lower the sample size is too small for reliable estimates.

Totals include the unspecified.

Due to rounding numbers do not necessarily add up to totals.

## 8. Assets

### 8.2 Households with and without access to land for agricultural purposes, by population group and sex of the household head

N (1 000)

Population group and sex of the household head	Access to land		Total
	Have access	Do not have access	
<b>All population groups</b>			
<b>Total</b>	<b>1 702</b>	<b>10 060</b>	<b>11 780</b>
Male	862	6 445	7 320
Female	839	3 606	4 452
<b>Black African</b>			
<b>Total</b>	<b>1 594</b>	<b>7 466</b>	<b>9 072</b>
Male	763	4 500	5 269

<b>Indian/Asian</b>			
<b>Total</b>	<b>2</b>	<b>280</b>	<b>282</b>
Male	2	224	226
Female	-	57	57
<b>White</b>			
<b>Total</b>	<b>92</b>	<b>1 382</b>	<b>1 479</b>
Male	86	1 083	1 173
Female	6	299	305

For all values of 10 000 or lower the sample size is too small for reliable estimates.

Totals include other and unspecified population group and sex of the head of the household.

Due to rounding numbers do not necessarily add up to totals.

## 8. Assets

### 8.3 Households with access to land for agricultural purposes, by farming activity and province

N (1 000)

Province	Farming activity						
	Field crops	Horticulture	Livestock excluding poultry	Orchards	Poultry	Other	None
<b>South Africa</b>	<b>1 394</b>	<b>46</b>	<b>402</b>	<b>72</b>	<b>415</b>	<b>19</b>	<b>140</b>
Western Cape	8	6	11	5	3	1	1
Eastern Cape	634	12	255	9	268	8	82
Northern Cape	3	-	8	1	1	1	1
Free State	29	-	18	3	8	1	3
KwaZulu-Natal	346	21	68	15	103	2	37
North West	37	3	16	2	12	1	7
Gauteng	13	1	2	4	2	1	6
Mpumalanga	31	0	13	1	8	2	1
Limpopo	293	3	10	32	12	1	1

For all values of 10 000 or lower the sample size is too small for reliable estimates.

Note that households could undertake more than one farming activity. Unspecified activities are excluded.

0 = more than nothing but less than 500

Due to rounding numbers do not necessarily add up to totals.

## 8. Assets

### 8.4 Households with access to land for agricultural purposes, by farming activity, population group and sex of the household head

N (1 000)

Population group and sex of household head	Farming activity						
	Field crops	Horticulture	Livestock excluding poultry	Orchards	Poultry	Other	None
<b>All population groups</b>							
<b>Total</b>	<b>1 394</b>	<b>46</b>	<b>402</b>	<b>72</b>	<b>415</b>	<b>19</b>	<b>140</b>
Male	678	28	232	49	207	9	76
Female	715	18	169	23	209	9	64
<b>Black African</b>							
<b>Total</b>	<b>1 348</b>	<b>37</b>	<b>347</b>	<b>58</b>	<b>401</b>	<b>13</b>	<b>128</b>

\* Other includes coloured, Indian/Asian, white and unspecified population groups. These groups are aggregated due to the small sample size.

For all values of 10 000 or lower the sample size is too small for reliable estimates.

0 = more than nothing but less than 500

Due to rounding numbers do not necessarily add up to totals.
